	Urgent	Not Urgent
Important	**Do - (Your MVP)** • Retrieve menus and nutrition information from the Purdue dining API. • Allow selection of a dining hall, date, and meal period. • Filter foods by preferences, such as vegetarian or vegan. • Let users add and remove foods and adjust serving quantities. • Display total calories, protein, carbohydrates, and fat. • Identify missing nutrition information.	**Schedule - (For V2.0+)** • Let users enter nutritional goals and compare their meal totals against those goals. • Support fractional serving quantities. • Automatic recommendations based on user preferences and nutritional goals.
Not Important	**Delegate - (Use a library)** • Parsing the API's JSON responses (Going to be done through Jackson or Gson). • Making HTTP requests (Going to be done through Java's HTTP Client) • Parsing dates and validating them (going to be done through Java's LocalDate)	**Delete - (Cut it)** • Generate a full day eating plan across multiple dining halls. • An interface that allows the program to work over the Purdue dining app. • Sharing meals users plan with each other.
